The Danish agricultural sector is highly export-oriented: a very large proportion of Danish agricultural production is exported and the proportion of agricultural commodities in Danish exports is much larger than in other industrialized countries. Hence, the international competitiveness of the Danish farm sector is of high importance not only for Danish farmers but also for the entire economy. However, in recent years, serious doubts about the international competitiveness of the Danish farm arose. Therefore, we will scrutinize the productivity and competitiveness of the Danish agricultural sector and compare it to six neighboring countries. For this, we use Data Envelopment Analysis (DEA) and a comprehensive farm-level dataset from EU's Farm Accountancy Data Network (FADN). The efficiencies of Danish farms are considerably lower than in Germany due to high wages and financing costs in Denmark.
